<p>NOVELTY Water soluble resin is impregnated to two or more sheets of water soluble polyvinyl alcohol group non-woven fabric.</p> <p>USE After using of the non-woven fabric melt in hot water at 70-100 °C or more, containing disinfectant, is used for medical treatment materials and base materials for medical care.</p> <p>ADVANTAGE The molded non-woven fabric is light and the sewage disposal is easy. The molded sheet is soft and has high tensile strength. The non-woven fabric sheet does not absorb moisture.</p>	<p>POLYMERS Preferred resin : Water soluble resin are polyvinyl alcohol group resin, polyoxy alkylene group containing polyvinyl alcohol group resin, polyvinyl pyrrolidone group resin and one or more kinds of polyalkylene oxide.</p> <p>Preferred method : Two or more water soluble non-woven fabric sheets are laminated or casted in a container by compression or vacuum casting or molded using tray. When the water soluble resin is heated, the melt exhibits adhesive property. A fluorine group water repellent is made to coexist in water soluble resin.
